

## Workflow to extract the right path

- Input data tool will read the list of sheet names
- Text to column tool will parse out the name into sheet name and file name
- Select tool selects relevant columns
- Filter tool filters out the A types tabs from the B type tabs to run through the macro

This would be the start of my macro. I want the A type tabs to go through the first Input data tool and the b type tabs to go through the second input data tool.
